DATASHEET

Nuance® eCopy® Quick Connect™

Custom connections quickly integrate paper into business processes

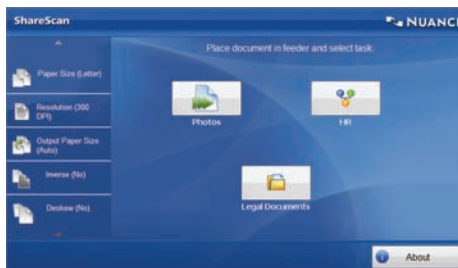

Quick Connect software plugs into eCopy ShareScan, enabling IT administrators to implement custom document distribution that dramatically increases business process efficiency. Quick Connect software is included with eCopy ShareScan® Suite™.

eCopy Quick Connect supports data publishing when used in conjunction with the eCopy Forms Processing Extender or other custom/3rd-party forms Extenders, allowing users to index and name files based on content extracted from their pages, further streamlining the scanning process. Workers spend even less time dealing with paper and data entry user errors are eliminated, ensuring greater accuracy and efficiency.

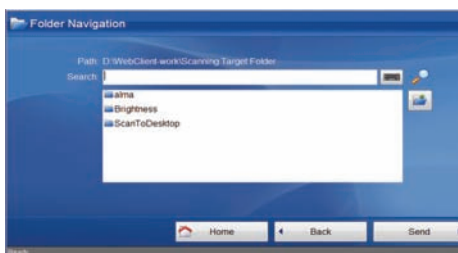

Quick Connect for eCopy ShareScan makes building custom document distribution solutions easy. Without programming, systems administrators can create custom “scan to” buttons that turn scanned images into PDF documents with index metadata, searchable text, and custom file names, then distribute them to multiple locations, including folders, Web sites, databases, and document management systems.

Use Quick Connect to easily integrate paper into critical business applications with the touch of a button. Solutions that can be built easily with Quick Connect include:

- **Accounts Payable** – Scan, index, validate, and link invoices and receipts to accounting system transactions
- **Purchasing** – Scan, index, and link quotes and proposals to procurement database records
- **Customer Service** – Scan and link customer agreements and supporting documents to CRM database records
- **Human Resources** – Scan, index, and link forms (e.g., I-9, W-2, benefits enrollment) to employee records in HR information systems
- **Sales** – Scan and link paper RFPs, handwritten notes, and other important documents to customer records in a CRM system
- **Legal** – Scan, index, and store text-searchable contracts and other legal documents directly into document management systems
- **Healthcare** – Share documents between healthcare systems that use HL7 format

Custom “scan to” buttons enable office workers to scan documents directly into electronic business processes or applications.

With Quick Connect, users navigate network folders, FTP sites, and Web folders, select databases, and store scanned documents using the touch panel at the scanning device, based on their network credentials.

CONTROL SCANNED DOCUMENT PROCESSING

System administrators can configure button displays, document destinations, file names, and index file properties:

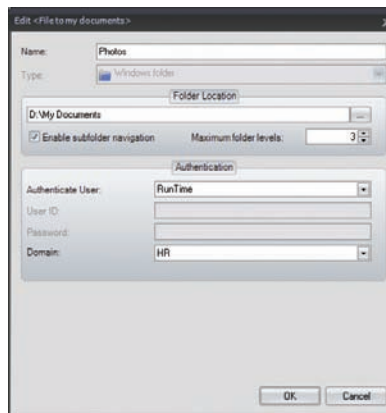

Property	Benefit
Display	Simplify document processing for office workers with custom, user-friendly scan-to buttons
Destinations	Streamline workflows and securely distribute scanned documents with authenticated access to network folders, WEBDAV, FTP, databases, SMTP addresses, and configured collections of these destinations
File names	Easily identify scanned files by defining file name conventions and enforcing consistent naming schemas
Index files	Easily locate scanned documents and apply to business processes with definable indexing

System administrators can configure image and file parameters:

Service	Benefit
Encryption	Secure sensitive information in scanned documents
Batching	Organize files based on configurable file size, number of pages, or blank page parameters
Searchable text	Locate and retrieve scanned documents using OCR and enterprise search technologies
Blank page removal	Reduce file size by eliminating unnecessary pages
Document tracking	Create an audit trail by saving a copy of every document scanned to a defined location
File format	Either pre-configure or allow for modification of file types including PDF, TIFF, and PDF/A
Variable XML Output	Share XML data between formats, for easier use by any back-end system
Expressions	Automate document storage by easily creating custom if "x," than "y" expressions

Configure Quick Connect to add document metadata to scanned images manually or dynamically via a barcode*; enable user validation of the metadata against back-office databases; and store the metadata in an XML file with the image in the final destination.

Administrators use a simple graphical interface to quickly build custom solutions for distributing scanned documents to multiple destinations.

*Requires eCopy Barcode Recognition Service (sold separately)

System Requirements

- eCopy ShareScan® v5.0 or higher
